Researcher Taking Notes

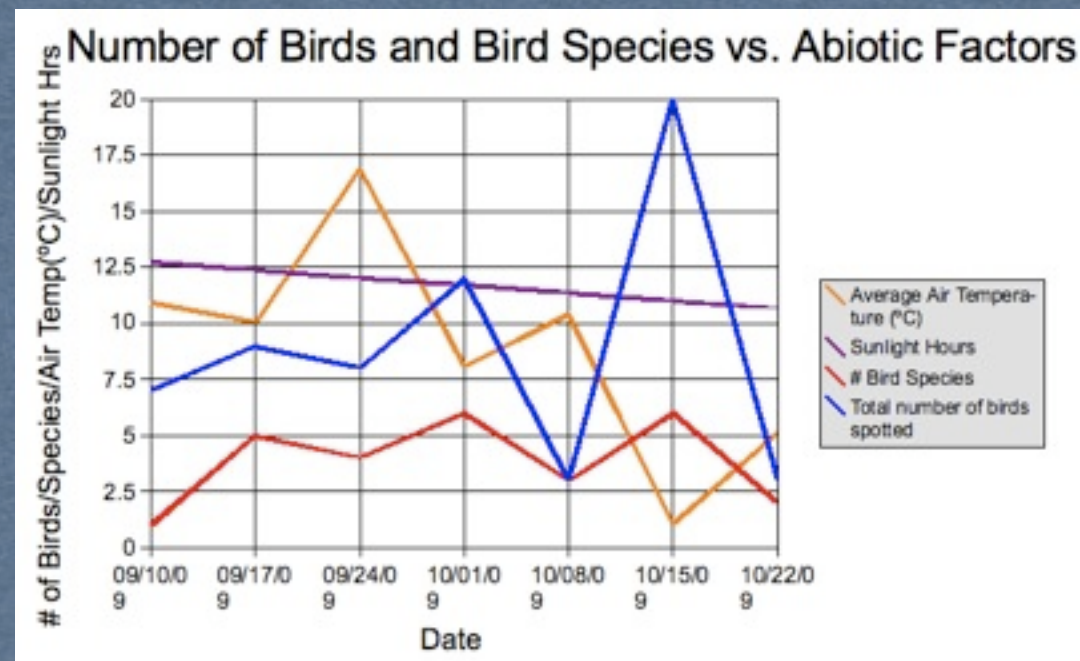

White-throated Sparrow

Researchers Observing a Bird

The purpose was to see how colder weather and climate conditions affected the amount of different species of birds seen and heard. Every Thursday the researchers traveled to the Cathance River Preserve to observe and record birds seen. The researchers walked the same path each week, on which many different species of bird were seen. Each week the temperature and conditions varied, and seemed to have effects on the amount of birds seen and heard. Based on the data found, there were more birds and more bird species on the colder days.

- Bird Species Identified:
- American Crow
  - American Goldfinch
  - Black-capped Chickadee
  - Blue Jay
  - Chipping Sparrow
  - Cooper's Hawk
  - Dark Eyed Junco
  - Downy Woodpecker
  - Golden-crowned Kinglet
  - Hairy Woodpecker
  - House Sparrow
  - Male Northern Parula Warbler
  - Mourning Dove
  - Pileated Woodpecker
  - Red-breasted Nuthatch
  - White-throated Sparrow

Acknowledgements:  
CREA for loaning binoculars.  
Mr. Evans for spotting some birds, various id's, and demonstrating the "pishing" technique.
